## CPS-PCH1 & LCX1 Photocell and Controller

The CPS-PCH1 is an exterior photocell with a threaded base for easy mounting. It is connected via two low voltage wires to the CPS-LCX Series Photocell Controllers. The LCX-1 is a single channel output controller which allows for user adjustable settings for sensitivity and delay. The LCX1 output goes into the [CPS/MCP Relay Panel](#)'s "Maintain" inputs, so it can be used to control a single relay, a group of relays, or the entire panel. Whenever automatic lighting control features are needed based on natural light, the CPS-PCH1 and CPS-LCX Series Controllers are the solution. This product can also be used in conjunction with the [CPS-1011 Timeclock](#) or the [Solution Series](#) control devices to create a complete lighting control system as required by the building owner.

Power for the LCX Controller is all low-voltage and is supplied from connections to the CPS/MCP Panel Power Supply. It is easy to mount the LCX Controller inside the low-voltage section of the CPS/MCP Panel.
