

The new ZoneZ product line from Touch-Plate® Lighting Controls is a feature-rich, flexible, and affordable lighting control solution.

There were several important design goals for the product line. One primary goal was to take care of all the existing Touch-Plate customers from 1946 to the present. There is a ZoneZ relay panel option to do exactly that!

Another design goal was to include a powerful User Interface so new features could be added via a fast and intuitive method. Most of the ZoneZ panels offer the User Interface. (ZoneZ LT series does not have the full User Interface, but it does include Master ON/OFF groups for every 6 relays.)

ZoneZ panels offer solutions for both relay switching and dimming applications. Finally, another major item was to make ZoneZ capable of interfacing with other products. ZoneZ panels can link in a network with Time-Keeper®, or it can be part of a DMX lighting control system, or it can be part of a Modbus protocol lighting control solution.

By designing control solutions in small mechanical footprints but keeping networking functions intact, Touch-Plate is able to reduce the overall wiring requirement with no forfeiture of features.

Call Touch-Plate® for assistance with any Commercial or Residential lighting control solution.
